Figures & tables:

Page 19 and DiVA, Figure 4; The reactions included in the section describing copper-catalyzed click chemistry (CuAAC) contains hydrazoic azide as a reactant and the products contain a triazole ring with a charged nitrogen. The reaction should include an azide instead of hydrazoic azide, and the charged nitrogen in the product should be positioned to bind to the substituent group (R3) in the triazole ring. In addition, the product in the strain-promoted click reaction (SPAAC) lack a double-bond between the two carbons in the triazole ring. Furthermore, this reaction leads to a mixture of isomers, which is indicated in the new figure. In addition, the abbreviation “CuACC” should be corrected to “CuAAC”.
